

Layout, Circulation & Aesthetics

Crucial for passing the final building audit inspection.

Spatial Layout

[] Main aisle circulation widths between rows of cubicles and opposing walls are between **1200mm and 1500mm**.

[] Partition materials chosen optimise space (e.g., using 13mm compact laminate panels over 100mm stud walls saves up to 90mm of floor space per run).

Visual Accessibility

[] A minimum **30% luminance contrast** is achieved between functional fixtures (such as the toilet seats) and the surrounding partition background colour.
